METHOD TO PROVIDE AND PERFORM A TELEPHONE SERVICE

Abstract:

Abstract not available for EP0928548

Abstract of corresponding document: US6574322

A method of providing and performing a telephone service, in which a computer system senses a calling subscriber number, and in which the computer system is constructed to perform a telephone service ordered by the subscriber of the calling subscriber number, in accordance with a data program. The invention is characterized in that the computer system includes a storage device which is caused to contain a predetermined number of transactions in the form of parts of a data program; in that the computer system fetches from the storage device a number of transactions which together form a data program for performing said service; in that when the subscriber orders a service, the service is stored in the form of codes that correspond to certain transactions from a multitude of transactions; in that said codes are caused to be stored in affiliation with the subscriber number, and in that when the subscriber number is sensed, or read, the computer system is caused to fetch said transactions through the medium of said codes and to execute said transactions and therewith perform said service.
